The Extreme Weather CHALLENGE

MISSION STATEMENT:
To facilitate preparedness for extreme heat and other weather-related emergencies at the neighborhood level in Southern Arizona.

TOPICS:
1. ASSESS YOUR READINESS
2. CHANGE VULNERABLE TO RESILIENT
3. PREPARE FOR A CHALLENGING FUTURE

© Climate Smart Southwest/Physicians for Social Responsibility

  • What To Do When the Power Goes Out p. 19-20
Part One
The Heat Emergency Scenario

1. A large high-pressure weather system is parked over the southwestern United States. After four days of record-breaking temperatures, demand on the electric system, combined with brownouts and fires in critical locations have caused the electricity to go out in the region extending from the border north to Phoenix, east to El Paso, and west to Los Angeles.

2. Campgrounds in higher elevations are over capacity, and many have no water service. Police close the Mt. Lemmon Highway due overcrowding and unsafe fire conditions.

3. Nighttime temperatures are over 90 degrees due to the heat island effect. Temperatures inside some homes exceed 85 degrees, the point at which the human body begins to reach temperatures that can lead to dehydration, heat exhaustion and stroke.

4. Hospitals have closed emergency rooms due to unsafe crowding of hospital corridors and lack of cooling. Similar conditions exist at city “cooling centers.”

5. After 48 hours without electricity, city water pumps can no longer provide the pressure needed to move water to taps.

6. Gas pumps at gas stations won’t work as well as cash registers in stores and restaurants.

7. Emergency services are swamped. Home care services are impacted and staffing may not be available.

8. Cell phone service is spotty.

9. Pharmacies are closed.

How can you help yourself, your family, and your neighbors to stay healthy and alive the next seven days in these conditions?
Community cohesion means people who live in the same place sticking together as a group. They do this because they think they know each other and can trust and rely on each other. This feeling of trust seems to be caused by how often they talk to each other, how many different places they talk to the same people, and how much they talk about with them.

**What Risk Management Options are available to you?**

- **Assume/Accept:** Acknowledge the existence of a particular risk, and make a deliberate decision to accept it without engaging in special efforts to control it.
- **Avoid:** Adjust requirements or constraints to eliminate or reduce the risk. This adjustment could be accommodated by a change in funding, schedule, or technical requirements.
- **Control:** Implement actions to minimize the impact or likelihood of the risk.
- **Transfer:** Reassign organizational accountability, responsibility, and authority to another stakeholder willing to accept the risk.
- **Watch/Monitor:** Monitor the environment for changes that affect the nature and/or the impact of the risk.

**Forewarning Indicators**

1. No nearby friends or family.
2. Age: Elderly and Children (especially those under 4 yrs old)
3. Health and ability to move: prisoners, disabled, homeless or drug dependent
4. Poorly insulated housing, no air conditioning, no shade trees.
5. Night time low temperatures above 85 degrees and high humidity.
6. Dehydration, heat exhaustion, heat stroke
7. No working phones, lights, or water service.
8. No emergency support from police or firemen.
9. “Shelter in Place” is ordered, but there are no safe places nearby to get cool.
Who is Vulnerable?

Instructions: On diagram below, chart the people and concerns raised by the self-assessments, in terms of your availability to help in a heat emergency as described by the scenario.

- In the “Home” circle. Put your name and others living in the same household in that circle.
- In the “Neighborhood” circle name those people who may need help in a heat emergency and are within walking distance of your home.
- In the "At-A-Distance" circle name people for whom you would be concerned in a heat emergency and require you to drive or use other forms of transportation to reach.
Part 2: Change Vulnerable to Resilient—Prepare for Weather-Related Emergencies

Dear Neighbors:

As our Tucson climate gets hotter and drier, we will lose electricity for longer periods from overloaded or fire-damaged lines. This can cause us to lose water, gas, phone, and even food services. Such breakdowns in public services and communications lead to serious health problems, injuries, and deaths.

This home worksheet is to help you find out how prepared your household is for these new climate conditions and whether you have vulnerable people in your home who will need special help in long power outages. Disabled people, children under 4, elderly people, people with chronic health problems, and renters may need assistance getting enough water, getting to a cool and/or shaded place, getting a ride to emergency or cooling centers, finding refrigerators for their medicines, and having someone to look after them.

The first part of this worksheet describes the people in your home and helps you find out what resources you have. The second part is to help you know which people in your house will have a health risk in a heat emergency and will need help.

How many people in your home are in each age group?

How many pets do you have? ________
What kinds are they? __________________________
How old is each? _____________________________

Do You Have Any Emergency Resource People in Your Home?

_____ Do any have police or other law enforcement training?
_____ Do any have fire department training?
_____ Do any have medical training? What types? _____________________________
_____ Do any have military emergency training?
_____ Can any give emergency rides?
_____ Can any cook and deliver emergency meals?

Does Your Home Have Any of These Emergency Supplies? [Check all that you have]:

_____ A radio? Circle which kind: battery/electrical/solar
_____ Enough trees and shrubs around your home to shade and cool it and you?
_____ A battery fan?
_____ Any kind of shade cloths? What kind and how big? __________________________
_____ Filled water containers? How many and what size? __________________________
_____ Hiking/camping water purifier kit?
_____ Television
_____ Home telephone? _______ Cell phone?
Email?
Solar oven or camping stove?
Outdoor grill and fuel?
Camping stove and fuel?
Flashlights, candles, large area battery or propane lights?
Emergency, non-perishable foods?
Portable carport, camp shelter or canopy for shade?
Swimming pool for cooling and drinking?
Independent solar system for home electricity?
Cisterns or other water storage system?
Home food garden?
Egg-laying chickens?
Emergency home generator (gas powered)?
Gas for the generator (48 hours worth)?

Which People in Your Home Have Health Risks? [Give the number of people who have each condition and give their ages]

High blood pressure? How old?________
High cholesterol? How old?________
Breathing problems or smokers? How old?________
Liver failure? How old?________
Dependence on drugs or alcohol? How old?________
Chronic illnesses? How old?________ What types?________
________________________________________________________

Do Any People in Your Home have disabilities? [Give the number of people and their ages for each limitation, including infants and children]

People who can't drive? How old?________
People who can't walk by themselves? How old?________
People who can't see or can't see well? How old?________
People who can't hear or can't hear well? How old?________
People who can't breathe easily? How old?________
People who can't talk well? How old?________
People who can't take care of themselves? How old?________
People with mental problems? How old?________
People with missing or disabled arms or legs? How old?________

Do you have someone in the neighborhood you can contact when you need help in emergencies? Yes _____ No _____

Name: _______________________________ Phone: _______________________________
Email: _______________________________
Part 2: Change Vulnerable to Resilient

Make Help Available

Record your thoughts in response to the questions below, then hear the thinking of each person in the group, listening rather than judging other’s responses. Keep a personal record of the commitments to action you are making.

A heat emergency with many, if not all, the conditions listed in the scenario can occur. Review your first meeting assessments. The negative impacts are preventable. What can you do to help yourself, your family, neighbors and more distant people you care about to handle such an emergency?

Who are you committed to helping?

What human resources and supplies need to be available. How can they be accessed and safely stored?

How can you and your neighbors coordinate assistance for people in your neighborhood who are unable to care for themselves in a heat emergency?
PART 3
Prepare for a Challenging Future

You can improve the safety of your home and neighborhoods. Adapting to extreme weather will be a long-term project. It will take many people and groups working together. What are some of the activities you can imagine helping your community become more resilient in the face of extreme conditions? List a few ideas below:

In small groups share your response to these questions. Take notes in the space provided beneath each question.

What can you and your neighbors do to create resilience to withstand heat and other forms of neighborhood stress?

What are the longer term projects you will make a commitment to complete? Consider who will do what within what timeframe. How will costs be shared?
Extreme Weather Challenge
Meeting Series Evaluation

Please give your feedback about how these Extreme Weather Challenge conversations made a difference in relationships with others in your community. Circle the answer that best describes your experience.

By participating in the Heat Emergency conversations...

1) I met some of my neighbors and learned their names:
   1-2 neighbors   3-5   6-10   11 or more

2) I subsequently talked to neighbors outside the meeting times.
   Yes   No

3) I shared my experience of these meetings with:
   Family   Friends   Others

4) Do you know where in your neighborhood would you go to seek information and coordination of aid?
   Yes   No

5) I learned about the risks of heat, causes of heat and ways to lessen the impact of heat.

6) I am taking action to lessen the likelihood of a hotter climate.
   Yes   No

7) Comments:

Thank you for taking the time to complete this evaluation. We invite comments on how we can improve the materials and approach. Ask your facilitator to forward evaluations to Michael Ray at 232 E. Limberlost Dr. Tucson, AZ 85705

http://www.fema.gov/community-emergency-response-teams
The Community Emergency Response Team (CERT) Program educates people about disaster preparedness for hazards that may impact their area and trains them in basic disaster response skills, such as fire safety, light search and rescue, team organization, and disaster medical operations.
Your body keeps itself cool by letting heat escape through the skin, and by evaporating sweat (perspiration). If your body does not cool properly or does not cool enough, you might suffer from a heat-related illness. Anyone can be susceptible to heat-related illness. Those at greatest risk are children under 4, adults over 65, homeless people, outdoor workers, people who are overweight, and people who are ill or on certain medications. Heat-related illness may be serious or even deadly if unattended.

Staying healthy during the summer is easier if you take the time to protect yourself by making sure you are drinking enough water and limiting your exposure to the heat. Follow these simple rules:

- **Drink water.** Even people that stay mostly indoors all day should drink at least 2 liters of water per day. People that spend time outdoors should drink 1 to 2 liters per hour that they are outdoors. People that do strenuous activity outdoors should be very careful, being your body can lose up to 4 liters of water per hour during strenuous activity. You should carry water with you and drink even if you do not feel thirsty. Be heat safe and avoid alcohol and caffeine, which dehydrate the body. Avoid using salt tablets unless directed to do so by a physician.

- **Dress for the heat.** Wear lightweight, light-colored clothing. Light colors will reflect away some of the sun’s energy. It is also a good idea to wear hats or to use an umbrella. Always apply sunscreen to exposed skin.

- **Eat small meals and eat more often.** Avoid foods that are high in protein which increase metabolic heat.

- **Slow down.** Avoid strenuous activity. If you must do strenuous activity, do it during the coolest part of the day, which is usually in the morning between 4:00 a.m. and 7:00 a.m.

- **Stay indoors when possible.**

- **Take regular breaks when engaged in physical activity on warm days.** Take time out to find a cool place. If you recognize that you, or someone else, are showing symptoms of a heat-related illness, stop activity and find a cool place. Remember, have fun, but stay cool!

### Signs & Symptoms of Heat-Related Illness

When temperatures are on the rise, watch for the following symptoms:

- **Thirst:** By the time your body tells you that you are thirsty, you are already mildly dehydrated.

- **Heat cramps:** Heat cramps are muscular pains and spasms due to heavy exertion. They usually involve the abdominal muscles or the legs. The loss of water and salt from heavy sweating causes heat cramps.

- **Heat Exhaustion:** Heat exhaustion is less dangerous than heat stroke. It typically occurs when people exercise heavily or work in a warm, humid place where body fluids are lost through heavy sweating. Fluid loss causes blood flow to decrease in the vital organs, resulting in a form of shock. With heat exhaustion, sweat does not evaporate as it should, possibly because of high humidity or too many layers of clothing. As a result, the body is not cooled properly. Signals include cool, moist, pale, flushed or red skin; heavy sweating; headache; nausea or vomiting; dizziness; and exhaustion. Body temperature will be near normal.

- **Heat Stroke:** Also known as sunstroke, heat stroke is life-threatening. The victim’s temperature control system, which produces sweating to cool the body, stops working. The body temperature can rise so high that brain damage and death may result if the body is not cooled quickly. Signals include hot, red and dry skin; changes in consciousness; rapid, weak pulse; and rapid, shallow breathing. Body temperature can be very high—sometimes as high as 105° F.

### Stages of Heat-Related Illness

Heat-related illness usually comes in stages. The signal of the first stage is thirst. Drinking water at this stage can prevent you from progressing to the more serious kinds of heat related illnesses. The next stage is muscle cramps. These cramps can be mild or very painful. If you are caring for a person who has heat cramps, have him or her stop activity and rest. If the person is fully awake and alert, have him or her drink small amounts of cool water or a commercial sports drink. Gently stretch the cramped muscle and hold the stretch for about
20 seconds, then gently massage the muscle. Repeat these steps if necessary. If the victim has no other signals of heat-related illness, the person may resume activity after the cramps stop.

The signals of the next, more serious stage of a heat-related illness (often called heat exhaustion) include:

- Cool, moist, pale skin (the skin may be red right after physical activity).
- Headache.
- Dizziness and weakness or exhaustion.
- Nausea.
- The skin may or may not feel hot.

The warning signs of the most serious stage of a heat-related illness (often called heat stroke or sun stroke) vary but may include:

- Vomiting.
- Confusion.
- Throbbing headache.
- Decreased alertness level or complete loss of consciousness.
- High body temperature (sometimes as high as 105° F).
- Skin may still be moist or the victim may stop sweating and the skin may be red, hot and dry.
- Rapid, weak pulse.
- Rapid, shallow breathing.
- Seizures.

**NOTE:** Heat stroke is life threatening. Call 9-1-1 or the local emergency number if you are suffering from any of the above symptoms.

**General Care for Heat Emergencies**

General care for heat emergencies include cooling the body, giving fluids, and minimizing shock. For specific heat-related emergencies, follow these steps:

- **For heat cramps or heat exhaustion:** Get the person to a cooler place and have the person rest in a comfortable position. If the person is fully awake and alert, give a half glass of cool water every 15 minutes. Do not let him or her drink too quickly. Do not give liquids with alcohol or caffeine in them, as they can make conditions worse. Remove or loosen tight clothing and apply cool, wet cloths such as towels or wet sheets or mist with water. Get the person into an air conditioned space if possible. Call 9-1-1 or the local emergency number if the person refuses water, vomits or loses consciousness.

- **For heat stroke:** Heat stroke is a life-threatening situation! Help is needed fast. Call 9-1-1 or your local EMS number. Move the person to a cooler place. Quickly cool the body using any means available, including cool water and ice. If you have ice packs or cold packs, wrap them in a cloth and place them on each of the victim’s wrists and ankles, in the armpits and on the neck to cool the large blood vessels. (Do not use rubbing alcohol because it closes the skin’s pores and prevents heat loss.) Wrap wet sheets around the body and place the person in front of a fan or air conditioner. Watch for signals of breathing problems and make sure the airway is clear. Keep the person lying down.

**WHAT TO DO WHEN THE POWER GOES OUT**
Planning in Advance for a Heat Emergency: Power outage for 72 Hours or longer
A Project of Climate Smart Southwest – PSR, AZ Chapter

The focus of this guide is on four areas of neighborhood resilience: water security, coolness without a power source, food security and communications: This resource sheet addresses (1) planning in advance and (2) what to have ready for a heat emergency.

**Planning Water Security:**
1. INSTALL or identify a NEIGHBORHOOD WATER CISTERN
2. Need cisterns to be kept full. Keep large bottles of water in your freezer.
3. Need filter to make water potable. Need two gallons of water per person per day in summer.
4. Need research on compostable toilets and other options to minimize water need.
5. Identify any other resources you may need:

**Identify The Cool Places In Your Neighborhood:**
1. Safe parks or community facilities
2. Homes with basements, if neighbors willing to share
3. Locations with lots of trees

**Keep Cool Supply list:**
1. Hat, spray bottles, water bottles, shade cloth.
2. Identify places to hang wet sheets for power free swamp cooling
3. Have freeze dried camp foods in stock

**Planning Food Security:**
1. ACQUIRE SOLAR OVEN(S) & LOCATE IN CENTRAL SPOT FOR ALL TO USE
2. Rethink kinds of food purchased – buy more dried or canned; less frozen or needing refrigeration.
3. Grow your own fresh vegetables and fruits; plant a citrus tree (grapefruit hardiest, lemon least hardy.
4. For cooking, use solar ovens, BBQ, wood and fire pit. Avoid adding heat to interiors. Cook outdoors.
5. Identify available generator to re-cool selected refrigerators.

**Keeping cool with batteries and generators or other power sources:**
1. Battery-operated desk fan available at Ace Hardware.
2. A generator could be used at central location the during heat of the day (with installation of appropriate electrical panel). Options are a gas-powered generator or one powered by solar panels and connected to a portable inverter.
3. Also could use electric car batteries as limited power source.

**Communication Resources:**
1. NEED RADIO POWERED BY BATTERIES, HAND CRANK OR SOLAR POWER IN THE NEIGHBORHOOD
2. Need source of news and resources when radio, TV, cell phone, computer not powered.
3. Decide on site for posting notices of news or needs. Publicize date/time and source of posting.
Critical Questions for your Neighborhood
1. Are we willing to share resources among our neighbors?
2. Would those with basements and cooler locations be willing to share space?
3. Where is the nearest cooling place, trees with grass?
4. Who among neighbors has certain expertise or skills?
5. Who has mobility limits or medical needs?
6. What about folks who don’t prepare?

What to do in a Heat Emergency: Finding Coolness And Safety Without Electric Power
Goal is to meet sustainable health need of 4 hours daily in areas with 85°F or less.

Keep Cool: Goal: meet sustainable health need of 4 hours daily in areas with 85°F or less.
1. IDENTIFY THE COOL PLACES IN YOUR NEIGHBORHOOD
2. Find shelter in the middle unit of multi-family housing or home with a basement.
3. Open windows at night; cover sunny windows in day; Use shade cloth to keep sun off windows
4. Wet your shirt as a portable evaporative cooler
5. Stay near trees
6. Use a spray bottle to dampen neck, inside of elbows and knees to feel cooler.
7. Hang wet sheets in breeze at slightly open doors and windows
8. Dip in a pool; rest in the shade

Keep Hydrated with Water:
1. Resources you already have: Stored water? Bathtubs (line with clean plastic sheeting)
   Cisterns? Pool?
2. Remember to drink water before you feel thirsty; in hot weather you can sweat out more fluid than your body can absorb in the same time period.
3. Drink before exposure, during and after heat exposure 16-32 oz./hour in hot weather according to the Arizona Department of Health Services.
4. Avoid alcoholic beverages which will cause more dehydration.

Communicate with neighbors and emergency resources:
1. KEEP IN TOUCH WITH YOUR NEIGHBORS, ESPECIALLY THOSE MOST VULNERABLE:
2. Organize community events, such as cooking, cooling areas, communication responsibility, etc.
3. Use message boards to post help, coordination and information update notices
4. Identify and use battery operated radios to keep in touch with current events
5. Charge cell phones with solar powered battery chargers
6. Organize emergency response when needed
7. Offer emotional support for distressed members of your community
